

## MEMORANDUM

---

Date: April 5, 2018

Project #: 22064.0

To: Manuel Abarca, PE, City of Longview  
From: Matt Bell and Nick Gross, Kittelson & Associates, Inc.  
Project: 3<sup>rd</sup> Avenue Pedestrian Crossing  
Subject: Final Pedestrian Crossing Assessment

---

### EXECUTIVE SUMMARY

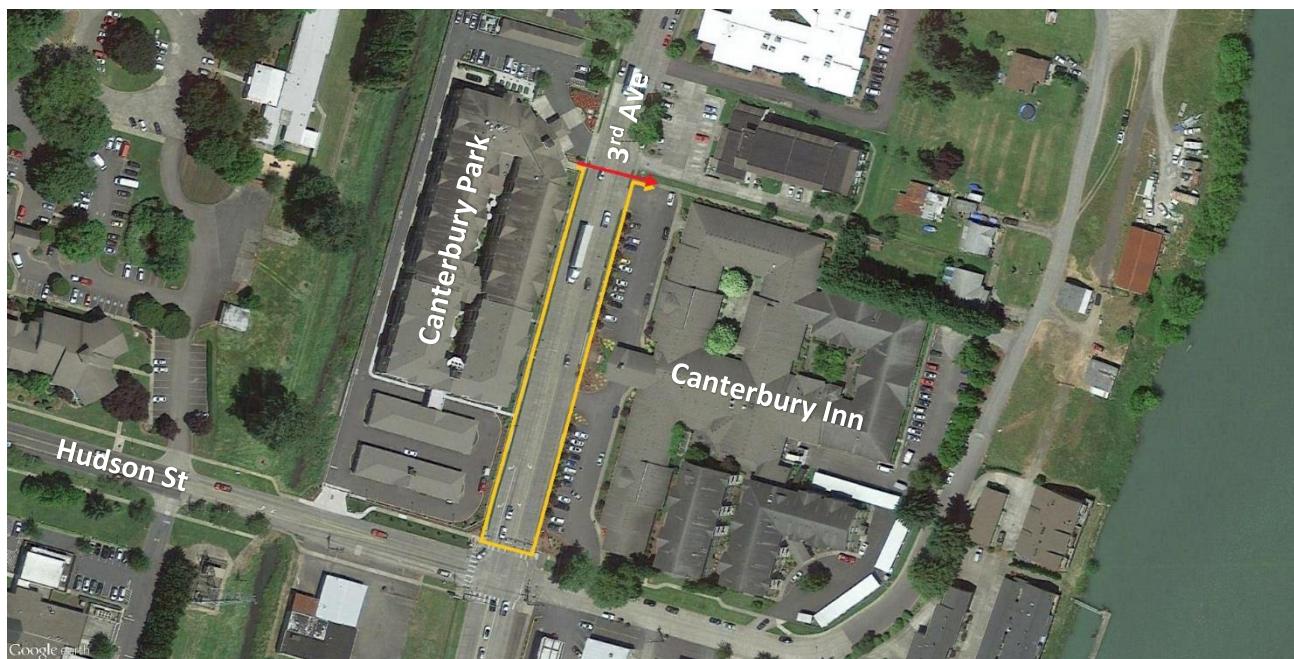

This memorandum summarizes the results of a pedestrian crossing assessment prepared on behalf of the City of Longview. The purpose of the assessment is to determine if an enhanced mid-block crossing adjacent to the Canterbury Park and Canterbury Inn residential facilities is supported by the study methodology. The assessment is based on field observations as well as conversations with Canterbury Park and City of Longview staff. Key findings are summarized below.

- A signalized pedestrian crossing is currently provided along 3<sup>rd</sup> Avenue at the 3<sup>rd</sup> Avenue/Hudson Street intersection, approximately 480-feet south of the proposed mid-block crossing.
- A total of 42 pedestrians crossed 3<sup>rd</sup> Avenue at the proposed mid-block crossing location over a 12-hour period (7:00 a.m. to 7:00 p.m.) in February 2018, including five during the morning, 14 during the mid-day, and five during the evening peak hours.
- A total of 15,320 vehicles traveled along 3<sup>rd</sup> Avenue over a 24-hour period in February 2018, including 989 during the morning, 1,177 during the mid-day, and 1,308 during the evening peak hours.
- The 85<sup>th</sup> percentile speeds along 3<sup>rd</sup> Avenue are 32 miles per hour (mph) in the northbound direction and 35 mph in the southbound direction. The posted speed limit is 35 mph.

The results of the assessment indicate that an enhanced mid-block crossing along 3<sup>rd</sup> Avenue adjacent to the Canterbury Park and Canterbury Inn residential facilities is NOT supported by the study methodology due to a lack of pedestrian activity. However, given the potential for increases in pedestrian activity at the proposed mid-block crossing, the City should continue to monitor the crossing and if/when pedestrian activity reaches the minimum requirement (20 crossings during the peak hour), consideration should be given to installing an enhanced mid-block crossing with a high level of crosswalk protection (i.e. curb extensions, high visibility pavement markings and signs, and flashing beacons). Additional information on the study methodology and findings is provided below.

## BACKGROUND

Residents of Canterbury Park and Canterbury Inn residential facilities have expressed the need for an enhanced mid-block crossing on 3<sup>rd</sup> Avenue to facilitate movement between the two facilities. Canterbury Park is an independent living facility located on the west side of 3<sup>rd</sup> Avenue and Canterbury Inn is an assisted living facility located on the east side of 3<sup>rd</sup> Avenue. Given the nature of the facilities, residents often make frequent trips across 3<sup>rd</sup> Avenue. Currently, residents cross at this location without the assistance of a marked crosswalk or travel approximately 960-feet out-of-direction to cross at the 3<sup>rd</sup> Avenue/Hudson Street intersection.

## STUDY AREA

The study area consists of the segment of 3<sup>rd</sup> Avenue adjacent to the Canterbury Park and Canterbury Inn residential facilities. An existing concrete pathway from Canterbury Park's main entrance leads southeast to 3<sup>rd</sup> Avenue and the location of the proposed mid-block crossing. A similar concrete pathway continues southeast from 3<sup>rd</sup> Avenue to Canterbury Inn's main entrance. The location and orientation of the existing concrete pathways create a natural pathway across 3<sup>rd</sup> Avenue at the proposed mid-block crossing location.

### Land-Uses

Land uses along 3<sup>rd</sup> Avenue primarily consist of high density residential on both sides of the roadway. In addition to Canterbury Park and Canterbury Inn, other residential facilities include the Canterbury Gardens memory care facility, Frontier Rehabilitation and Extended Care Center, and the Fremont Village apartments; each of which are located within close proximity to the proposed mid-block crossing. The surrounding area is generally built out with minimal opportunities for new development.

## TRANSPORTATION FACILITIES

### Roadway Facilities

3<sup>rd</sup> Avenue (SR 411) is a principle arterial that travels north-south along the eastern boundary of the City of Longview, parallel to the Cowlitz River. North of the study area, 3<sup>rd</sup> Avenue transitions to 1<sup>st</sup> Avenue and connects to Interstate 5 (I-5) via Allen Street. South of the study area, 3<sup>rd</sup> Avenue connects to downtown Longview via Hudson Street and Tenant Way (SR 432), which also provides access to I-5. 3<sup>rd</sup> Avenue also continues south to Industrial Way (SR 432), which connects to the Lewis and Clark Bridge.

### *Jurisdiction*

The City of Longview has jurisdiction over 3<sup>rd</sup> Avenue and the adjacent roadways, including Hudson Street.

### *Functional Classification*

3<sup>rd</sup> Avenue (SR 411) is classified as a principle arterial by the City of Longview Comprehensive Plan (Reference 1). As a principle arterial, 3<sup>rd</sup> Avenue is intended to provide a direct connection to the State highways and other limited access facilities. Arterials provide circulation and access as well as a link with State and federal highways. Arterials are the widest streets and are designed to carry heavy volumes of traffic.

### *Cross Section*

3<sup>rd</sup> Avenue currently has a three-lane cross section within the vicinity of the proposed mid-block crossing, including two 11-foot travel lanes (one in each direction) and one 12-foot center two-way left-turn (TWLT) lane. There are also two 8-foot parking lanes (one in each direction) north of Canterbury Park. South of Canterbury Park, on-street parking is prohibited on the west side of the roadway. The overall paved width of 3<sup>rd</sup> Avenue is approximately 50 feet.

### *Traffic Control and Signage*

The closest traffic signal is located at the 3<sup>rd</sup> Avenue/Hudson Street intersection approximately 480-feet south of the proposed mid-block crossing location. Marked crosswalks are provided across all four legs of the signalized intersection. The crosswalks are pedestrian actuated with pedestrian pushbuttons and pedestrian signal heads. Per discussions with Canterbury Park staff, there are several challenges associated with using the signal. The challenges identified by Canterbury Park staff include:

- *The location of the traffic signal results in out-of-direction travel for Canterbury residents who are elderly and tend to have reduced mobility.*
- *The traffic signal does not provide sufficient time for pedestrians to cross the street.*
  - Per signal timing data provided by the City, the traffic signal provides 5 seconds of walk time followed by 15 seconds of flash don't walk time across the north leg of the intersection.

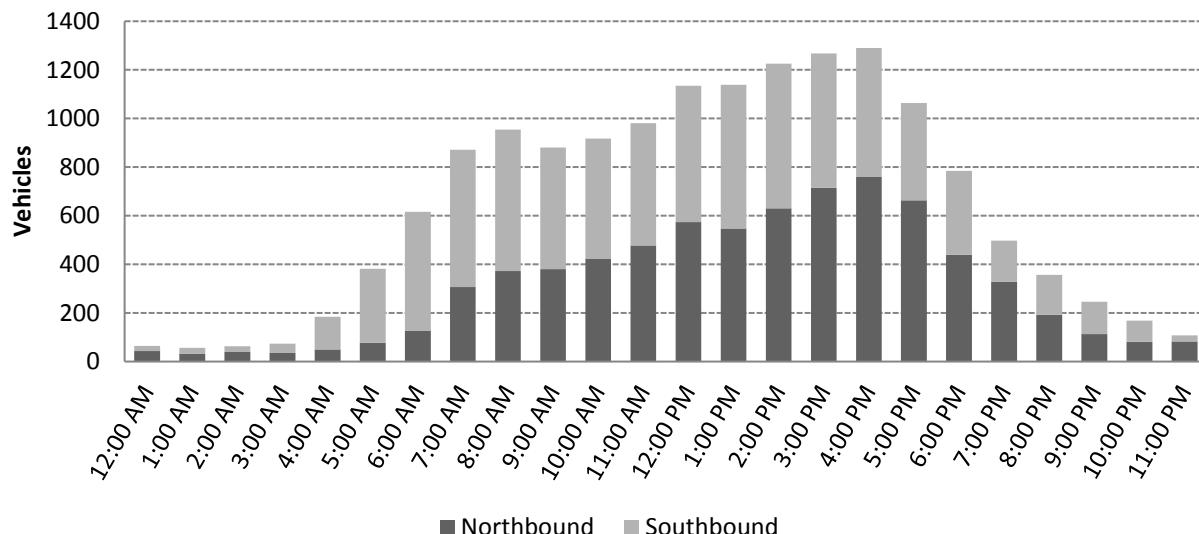

- The pedestrian heads are not countdown pedestrian heads, which means pedestrians that approach the intersection after it has been actuated do not know how much time they have to cross.
- *Motorists do not yield to pedestrians crossing the north leg of the intersection.*
  - Per the signal timing data, the eastbound and westbound approaches have permitted left-turn phasing. With permitted left-turn phasing, vehicle and pedestrian movements can occur at the same time.
- *The pedestrian ramps do not align with the crosswalks, particularly in the northwest corner of the intersection.*

Manual turning movement counts conducted at the intersection show that the eastbound left- and southbound right-turn movements are relatively high during the weekday AM and PM peak hours. An evaluation of the intersection using Synchro 9 modeling software indicates that the intersection is currently operating acceptably per the City's applicable mobility standards during the peak time periods. Further evaluation of the intersection indicates that it would continue to operate acceptable with protected left-turn phasing at the eastbound approach, particularly if the left-turn lags like the northbound and southbound approaches. With the provision of protected left-turn phasing, pedestrians would cross the north leg of the intersection during a separate phase from the left-turn movement. *Attachment "A" contains the turning movement counts conducted at the intersection. Attachment "B" contains the worksheets used to evaluation traffic operations as well as potential mitigation measures.*

## Traffic Volumes

Traffic volume data was collected along 3<sup>rd</sup> Avenue north of Hudson Street in February 2018. The data includes the total number of vehicles that traveled along 3<sup>rd</sup> Avenue over a 24-hour period. Chart 1 displays the hourly traffic volume data by direction.

**Chart 1: Daily Traffic Volumes along 3<sup>rd</sup> Avenue**

As shown in Chart 1, traffic volumes along 3<sup>rd</sup> Avenue increase steadily throughout the day with morning, mid-day, and evening peak hours occurring at 7:45 a.m., 12:45 p.m., and 3:45 p.m., respectively. Based on the data, a total of 15,320 vehicles were counted over the 24-hour period, including 989 during the morning, 1,177 during the mid-day, and 1,308 during the evening peak hours. *The traffic volume data is provided in Attachment "C".*

### ***Travel Speeds***

Travel speed data was collected along 3<sup>rd</sup> Avenue north of Hudson Street over a 24-hour period in February 2018. Based on the data, the 85<sup>th</sup> percentile speeds are 32 miles per hour (mph) in the northbound direction and 35 mph in the southbound direction. The posted speed limit is 35 mph. *The travel speed data is provided in Attachment "D".*

### ***Heavy Vehicle (Truck) Percentages***

Heavy vehicle data was collected along 3<sup>rd</sup> Avenue north of Hudson Street over a 24-hour period in February 2018. Based on the data, approximately 3.6 percent of all northbound traffic and 4.2 percent of all southbound traffic consists of heavy vehicles. *The heavy vehicle percentage data is included in Attachment "E".*

### ***Other Roadway Considerations***

#### ***Illumination***

Illumination is currently provided by street lights installed at approximate 230-foot intervals along the both side of 3<sup>rd</sup> Avenue. An existing street light is provided on the west side of the roadway, south of the Canterbury Park entrance and just north of the proposed mid-block crossing.

#### ***Topography***

3<sup>rd</sup> Avenue is relatively flat and straight within the vicinity of the proposed mid-block crossing. As indicated below, the horizontal curve to the north does not limit sight-distance at the southbound approach to the proposed mid-block crossing.

#### ***Vegetation***

At the time of the field investigation, vegetation along both sides of 3<sup>rd</sup> Avenue was maintained and did not limit sight distance along the roadway or at the proposed mid-block crossing.

#### ***Sight Distance***

The posted speed limit of 35 mph was used to calculate stopping sight distance requirements along 3<sup>rd</sup> Avenue in accordance with the methodology identified in the standard reference manual, *A Policy on Geometric Design of Highway and Streets*, published by the American Association of State Highway and Transportation Officials (AASHTO – Reference 2). Accordingly, the stopping sight distance requirement is 246-feet. Given this requirement, there is currently sufficient stopping sight distance along 3<sup>rd</sup> Avenue to safely stop a moving vehicle in advance of the proposed mid-block crossing.

## PEDESTRIAN FACILITIES

### *Sidewalks*

Continuous sidewalks are provided along both sides of 3<sup>rd</sup> Avenue and appear to be in good condition. A 3-foot landscape strip is provided between the sidewalk and outside travel lane on both sides of the roadway. All sidewalks are free from any impediments such as utility poles, light poles, fire hydrants, etc. Concrete walking paths are also provided at the east and westbound approaches to the proposed mid-block crossing location. The concrete pathway on the west side of 3<sup>rd</sup> Avenue connects to the main entrance of Canterbury Park, while the concrete pathway on the east side of 3<sup>rd</sup> Avenue connects to the main entrance of Canterbury Inn.

### *Crosswalks*

The closest marked crosswalk is located on the north leg of the 3<sup>rd</sup> Avenue/Hudson Street intersection approximately 480-feet south. The intersection includes a pedestrian actuated traffic signal with pedestrian push button and pedestrian signal heads.

### *Pedestrian Activity*

Pedestrian activity data was collected along 3<sup>rd</sup> Avenue at the proposed mid-block crossing in February 2018. The data includes the total number of pedestrians that crossed 3<sup>rd</sup> Avenue over a 12-hour period from 7:00 a.m. to 7:00 p.m. The following provides a summary of the pedestrian data.

- Five pedestrians crossed 3<sup>rd</sup> Avenue during the morning peak hour for pedestrian activity (8:30 a.m.); two pedestrians crossed during the morning peak hour for vehicles (7:45 a.m.).
- 14 pedestrians crossed 3<sup>rd</sup> Avenue during the afternoon peak for pedestrian activity (1:00 p.m.); eight pedestrians crossed during the afternoon peak hour for vehicles (12:45 p.m.).
- Five pedestrians crossed 3<sup>rd</sup> Avenue during the evening peak hour for pedestrian activity (5:30 p.m.); two pedestrians crossed during the evening peak hour for vehicles (3:45 p.m.).

It should be noted that the pedestrian counts were conducted in February and while no inclement weather was present, anecdotal evidence suggests that pedestrian activity increases during the summer months. Also, while the pedestrian counts were collected at the proposed mid-block crossing location, additional crossings may have occurred further to the north and south of the crossing and could be consolidated by a potential crossing. *The pedestrian crossing data is provided in Attachment "F".*

## TRANSIT FACILITIES AND SERVICES

### *Transit Service*

Transit for Longview residents is provided by River Cities Transit (RCT). Information regarding local transit service within the study area was obtained from the current RCT system map and bus schedule. RCT Line 45 provides frequent service along 3<sup>rd</sup> Avenue on approximately 35-minute headways. Service is provided Monday through Friday from 6:34 a.m. to 6:34 p.m. and on Saturday's from 8:04 a.m. to 5:34 p.m. The

closest transit stop is located just north of Canterbury Inn on the east side of 3<sup>rd</sup> Avenue and is served by RCT Line 45.

## PLANNED AND PENDING TRANSPORTATION FACILITIES

The Longview Comprehensive Plan identifies a number of potential projects that will improve traffic safety, increase traffic flow, increase circulation, improve freight mobility, and/or enhance the beautification of the City's roadways. No projects have been identified in the Comprehensive Plan as having the potential to impact conditions along 3<sup>rd</sup>.

## CROSSWALK ASSESSMENT

A crosswalk assessment was conducted to determine if the proposed mid-block crossing would be supported by the study methodology under existing traffic conditions. The results of the assessment are described below.

### Gap Analysis

The National Cooperative Highway Research Program (NCHRP) Report 562 *Improving Pedestrian Safety at Unsignalized Crossings* (Reference 3) provides a methodology for evaluating appropriate levels of crosswalk protection that considers traffic volumes, travel speeds, and pedestrian activity as well as a number of other factors. The methodology was applied to the proposed mid-block crossing under existing traffic conditions.

### ***Existing Conditions***

Table 1 summarizes the existing traffic volumes, travel speeds, and pedestrian activity at the proposed mid-block crossing during the morning, mid-day, and evening peak hours.

**Table 1: Existing Conditions – 3<sup>rd</sup> Avenue at Canterbury Park Main Entrance**

Peak Hour	Morning Peak Hour			Afternoon Peak Hour			Evening Peak Hour		
	Traffic Volume	Travel Speed	Ped Crossings	Traffic Volume	Travel Speed	Ped Crossings	Traffic Volume	Travel Speed	Ped Crossings
Vehicle Peak	989	35	2	1,177	35	8	1,308	35	2
Pedestrian Peak	913	35	5	1,138	35	14	919	35	5

An assessment of the traffic volumes shown in Table 1 led to the conclusion that an enhanced pedestrian crossing at the proposed mid-block crossing location is *NOT* supported by the study methodology under existing traffic conditions due to a lack of pedestrian activity. *The worksheets used in the existing conditions evaluation are included in Attachment "G".* The NCHRP 562 methodology requires a minimum of 20 pedestrian crossings during the peak hour to support minimal crossing treatments. As pedestrian crossing volumes increase, the level of crosswalk protection needed also increases.

### Sensitivity Analysis

Given the potential for increases in pedestrian activity at the study location, a sensitivity analysis was conducted to determine the extent to which various crossing treatments could accommodate increases in pedestrian activity and/or traffic volumes. The sensitivity analysis includes the following scenarios:

- Scenario 1 (traffic increase & no pedestrian increase): An increase in traffic volumes of up to 20 percent with no increase in pedestrian crossings.
  - The results of this analysis indicate that an enhanced mid-block crossing is not supported.
- Scenario 2 (no traffic increase & pedestrian increase): No increase in traffic volumes with an increase of up to 20 pedestrian crossings – this represents an increase of up to 15 pedestrians during the morning and evening peak hours and six pedestrians during the mid-day peak hour.
  - The results of this analysis indicate that an enhanced mid-block crossing with a high level of crosswalk protection is supported.
- Scenario 3 (traffic increase & pedestrian increase): An increase in traffic volumes of up to 20 percent with an increase of up to 20 pedestrian crossings.
  - The results of this analysis indicate that an enhanced mid-block crossing with a high level of crosswalk protection is supported.

The results of the sensitivity analysis indicate that an increase in pedestrian activity has a more significant impact on the need for an enhanced mid-block crossing than an increase in vehicle activity. In addition, once the minimum number of pedestrians needed to support an enhanced mid-block crossing is reached, the type of crossing treatment necessary to support the minimum level of pedestrian activity can accommodate a significant increase in pedestrian activity. *The work sheets used in the sensitivity evaluations are included in Attachment "H".*

## FINDINGS AND RECOMMENDATIONS

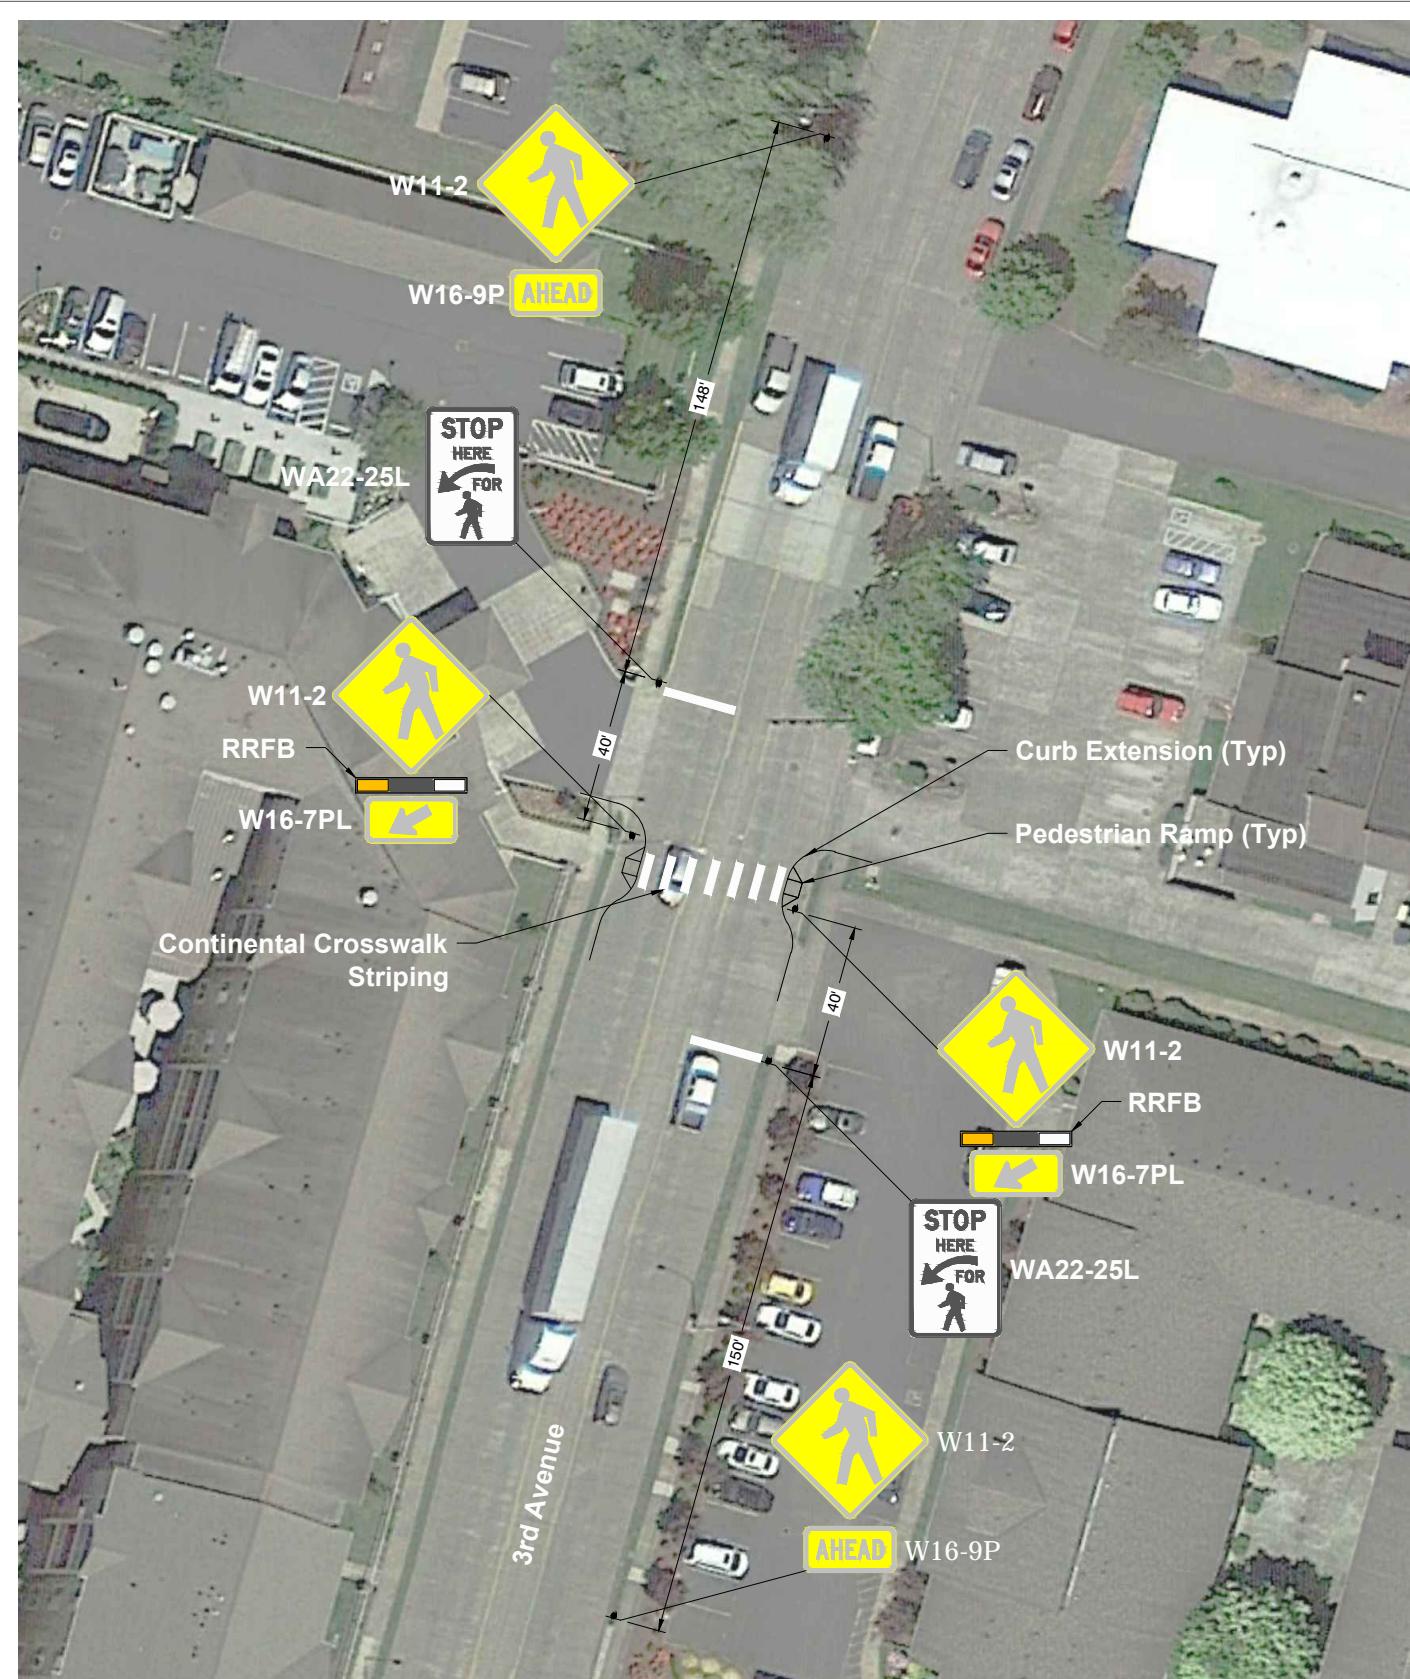

The results of the assessment indicate that an enhanced mid-block crossing along 3<sup>rd</sup> Avenue adjacent to the Canterbury Park and Canterbury Inn assisted living facilities is NOT supported by the study methodology. However, given the potential for increases in pedestrian activity at the proposed mid-block crossing, the City should continue to monitor the crossing and if/when pedestrian activity reaches the minimum requirement (20 crossings during the peak hour), consideration should be given to installing an enhanced mid-block crossing with a high level of crosswalk protection. The following summarizes the recommended crossing treatments needed to improve pedestrian and vehicle access and circulation.

### Recommended Crossing Treatments

Recognizing that the implementation of enhanced crossing treatments will likely depend on policies, priorities and available funding, the following recommendations are presented according to their simplicity and anticipated time and cost constraints. All crosswalk treatments should be consistent with the guidelines found in the Manual on Uniform Traffic Control Devices (MUTCD – Reference 4).

- Modify the eastbound approach to the 3<sup>rd</sup> Avenue/Hudson Street intersection to provide a separate eastbound left-turn lane and a shared through/right-turn lane.
  - This may require modifications to the signing and striping at the eastbound and westbound approaches to the intersection.
- Modify the traffic signal at the 3<sup>rd</sup> Avenue/Hudson Street intersection to provide protected left-turn phasing at the eastbound approach – lag the left-turn movement and increase the walk time for the east-west movement.
- Upgrade the pedestrian signal heads with countdown modules at the 3<sup>rd</sup> Avenue/Hudson Street intersection.
  - This improvement may trigger the need to update the pedestrian ramps to current Americans with Disabilities Act (ADA) standards.
- Monitor the proposed mid-block crossing and if/when pedestrian activity reaches the minimum requirement, consideration should be given to installing an enhanced mid-block crossing with the following crossing treatments:
  - Curb extensions on both sides of the proposed mid-block crossing.
  - ADA compliant pedestrian ramps at both ends of the crossing per City standards.
  - High visibility crosswalk pavement markings and signs per the MUTCD.
  - Rectangular Rapid Flash Beacons (RRFB) on the crosswalk signs.
  - Advance stop bars at each approach with “Stop Here for Pedestrian” signs.
  - Advance warning signs at each approach.

Figure 1 illustrates the potential mid-block pedestrian crossing treatments.

Potential Mid-block Pedestrian Crossing Treatments

## GUIDELINES FOR PEDESTRIAN CROSSING TREATMENTS

This spreadsheet combines Worksheet 1 and Worksheet 2 (Appendix A, pages 69-70) of TCRP Report 112/NCHRP Report 562 (*Improving Pedestrian Safety at Unsignalized Intersections*) into an electronic format. This spreadsheet should be used in conjunction with, and not independent of, Appendix A documentation.

### Key

	This spreadsheet is still under development, please inform TTI if errors are identified.		
	Blue fields contain descriptive information.		
	Green fields are required and must be completed.		
	Tan fields are adjustments that are filled out only under certain conditions (follow instructions to the left of the cell).		

Analyst and Site Information			
Analyst	KAI	Major Street	3rd Avenue
Analysis Date	March 16, 2018	Minor Street or Location	N/A
Data Collection Date	February 7, 2018	Peak Hour	7:45 AM (Veh Peak)
Step 1: Select worksheet:			
Posted or statutory speed limit (or 85th percentile speed) on the major street (mph)			1a
Is the population of the surrounding area <10,000? (enter YES or NO)			1b
Step 2: Does the crossing meet minimum pedestrian volumes to be considered for a traffic control device?			
Peak-hour pedestrian volume (ped/h), $V_p$			2a
Result: Consider raised median islands, curb extensions, traffic calming, etc. as feasible.			
Step 3: Does the crossing meet the pedestrian warrant for a traffic signal?			
Major road volume, total of both approaches during peak hour (veh/h), $V_{maj-s}$			3a
[Calculated automatically] Preliminary (before min. threshold) peak hour pedestrian volume to meet warrant			3b
[Calculated automatically] Minimum required peak hour pedestrian volume to meet traffic signal warrant			3c
Is 15th percentile crossing speed of pedestrians less than 3.5 ft/s (1.1 m/s)? (enter YES or NO)			3d
If 15th percentile crossing speed of pedestrians is less than 3.5 ft/s (1.1 m/s), then reduce 3c by up to 50%.		% rate of reduction for 3c (up to 50%)	3e
		Reduced value or 3c	3f
Result:			
Step 4: Estimate pedestrian delay.			
Pedestrian crossing distance, curb to curb (ft), $L$			4a
Pedestrian walking speed (ft/s), $S_p$ (suggested speed = 3.5 ft/s)			4b
Pedestrian start-up time and end clearance time (s), $t_s$ (suggested start-up time = 3 sec)			4c
[Calculated automatically] Critical gap required for crossing pedestrian (s), $t_c$			4d
Major road volume, total both approaches OR approach being crossed if raised median island is present, during peak hour (veh/h), $V_{maj-d}$			4e
Major road flow rate (veh/s), $v$			4f
Average pedestrian delay (s/person), $d_p$			4g
Total pedestrian delay (h), $D_p$ The value in 4h is the calculated estimated delay for all pedestrians crossing the major roadway without a crossing treatment (assumes 0% compliance). If the actual total pedestrian delay has been measured at the site, that value can be entered in 4i to replace the calculated value in 4h.			4h
			4i
Step 5: Select treatment based up on total pedestrian delay and expected motorist compliance.			
Expected motorist compliance at pedestrian crossings in region: enter HIGH for High Compliance or LOW for Low Compliance			5a
Treatment Category:		Consider raised median islands, curb extensions, traffic calming, etc. as feasible.	

This worksheet provides general recommendations on pedestrian crossing treatments to consider at unsignalized intersections; in all cases, engineering judgment should be used in selecting a specific treatment for installation. This worksheet does not apply to school crossings. In addition to the results provided by this worksheet, users should consider whether a pedestrian treatment could present an increased safety risk to pedestrians, such as where there is poor sight distance, complex geometrics, or nearby traffic signals.

Expected motorist compliance at pedestrian crossings in region: enter HIGH for High Compliance or LOW for Low Compliance			5a
Treatment Category:		RED	

This worksheet provides general recommendations on pedestrian crossing treatments to consider at unsignalized intersections; in all cases, engineering judgment should be used in selecting a specific treatment for installation. This worksheet does not apply to school crossings. In addition to the results provided by this worksheet, users should consider whether a pedestrian treatment could present an increased safety risk to pedestrians, such as where there is poor sight distance, complex geometrics, or nearby traffic signals.

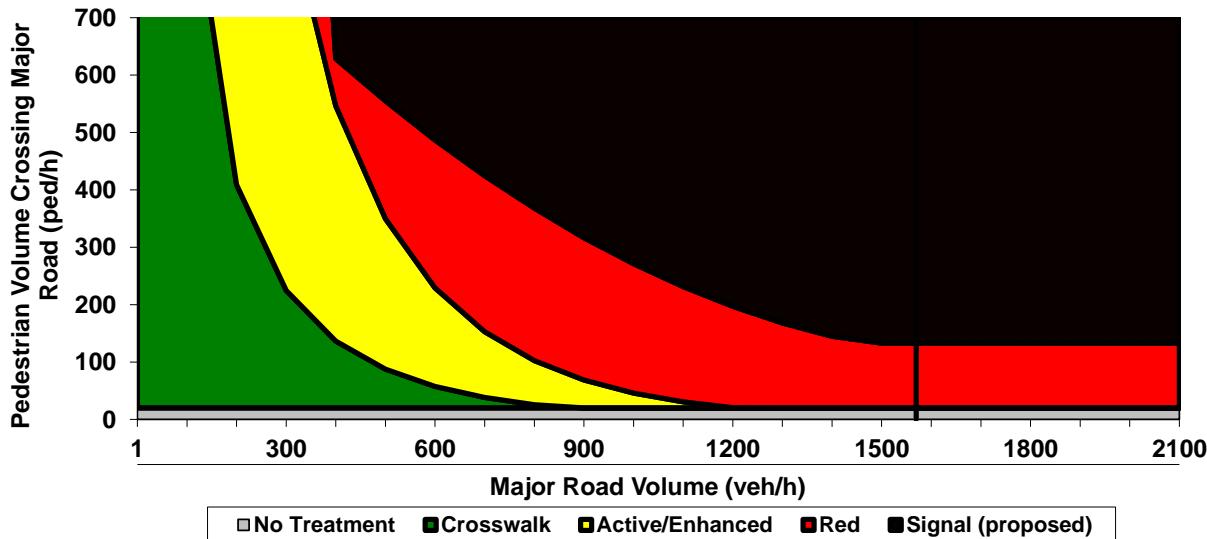

## GUIDELINES FOR PEDESTRIAN CROSSING TREATMENTS

This spreadsheet combines Worksheet 1 and Worksheet 2 (Appendix A, pages 69-70) of TCRP Report 112/NCHRP Report 562 (*Improving Pedestrian Safety at Unsignalized Intersections*) into an electronic format. This spreadsheet should be used in conjunction with, and not independent of, Appendix A documentation.

	Blue fields contain descriptive information.
	Green fields are required and must be completed.
	Tan fields are adjustments that are filled out only under certain conditions (follow instructions to the left of the cell).

Analyst and Site Information			
Analyst	KAI	Major Street	3rd Avenue
	Analysis Date		Minor Street or Location
	Data Collection Date		Peak Hour
<b>Step 1: Select worksheet:</b>			
Posted or statutory speed limit (or 85th percentile speed) on the major street (mph)		1a	35
Is the population of the surrounding area <10,000? (enter <b>YES</b> or <b>NO</b> )		1b	NO
<b>Step 2: Does the crossing meet minimum pedestrian volumes to be considered for a traffic control device?</b>			
Peak-hour pedestrian volume (ped/h), $V_p$		2a	20
<b>Result:</b> Go to step 3.			
<b>Step 3: Does the crossing meet the pedestrian warrant for a traffic signal?</b>			
Major road volume, total of both approaches during peak hour (veh/h), $V_{maj-s}$		3a	1569.6
[Calculated automatically] Preliminary (before min. threshold) peak hour pedestrian volume to meet warrant		3b	133
[Calculated automatically] Minimum required peak hour pedestrian volume to meet traffic signal warrant		3c	133
Is 15th percentile crossing speed of pedestrians less than 3.5 ft/s (1.1 m/s)? (enter <b>YES</b> or <b>NO</b> )		3d	Yes
If 15th percentile crossing speed of pedestrians is less than 3.5 ft/s (1.1 m/s), then reduce 3c by up to 50%.		3e	50%
		3f	67
<b>Result:</b> The signal warrant is not met. Go to step 4.			
<b>Step 4: Estimate pedestrian delay.</b>			
Pedestrian crossing distance, curb to curb (ft), $L$		4a	50
Pedestrian walking speed (ft/s), $S_p$ (suggested speed = 3.5 ft/s)		4b	3.5
Pedestrian start-up time and end clearance time (s), $t_s$ (suggested start-up time = 3 sec)		4c	3
[Calculated automatically] Critical gap required for crossing pedestrian (s), $t_c$		4d	17
Major road volume, total both approaches OR approach being crossed if raised median island is present, during peak hour (veh/h), $V_{maj-d}$		4e	1569.6
Major road flow rate (veh/s), $v$		4f	0.44
Average pedestrian delay (s/person), $d_p$		4g	4548
Total pedestrian delay (h), $D_p$ The value in 4h is the calculated estimated delay for all pedestrians crossing the major roadway without a crossing treatment (assumes 0% compliance). If the actual total pedestrian delay has been measured at the site, that value can be entered in 4i to replace the calculated value in 4h.		4h	25.3
		4i	
<b>Step 5: Select treatment based up on total pedestrian delay and expected motorist compliance.</b>			
Expected motorist compliance at pedestrian crossings in region: enter <b>HIGH</b> for High Compliance or <b>LOW</b> for Low Compliance		5a	Low
<b>Treatment Category:</b>		<b>RED</b>	

This worksheet provides general recommendations on pedestrian crossing treatments to consider at unsignalized intersections; in all cases, engineering judgment should be used in selecting a specific treatment for installation. This worksheet does not apply to school crossings. Average pedestrian delay (s/person), $d_p$			4g
Total pedestrian delay (h), $D_p$ The value in 4h is the calculated estimated delay for all pedestrians crossing the major roadway without a crossing treatment (assumes 0% compliance). If the actual total pedestrian delay has been measured at the site, that value can be entered in 4i to replace the calculated value in 4h.			4h
			4i
Step 5: Select treatment based up on total pedestrian delay and expected motorist compliance.			
Expected motorist compliance at pedestrian crossings in region: enter HIGH for High Compliance or LOW for Low Compliance			5a
Treatment Category:		RED	

This worksheet provides general recommendations on pedestrian crossing treatments to consider at unsignalized intersections; in all cases, engineering judgment should be used in selecting a specific treatment for installation. This worksheet does not apply to school crossings. In addition to the results provided by this worksheet, users should consider whether a pedestrian treatment could present an increased safety risk to pedestrians, such as where there is poor sight distance, complex geometrics, or nearby traffic signals.

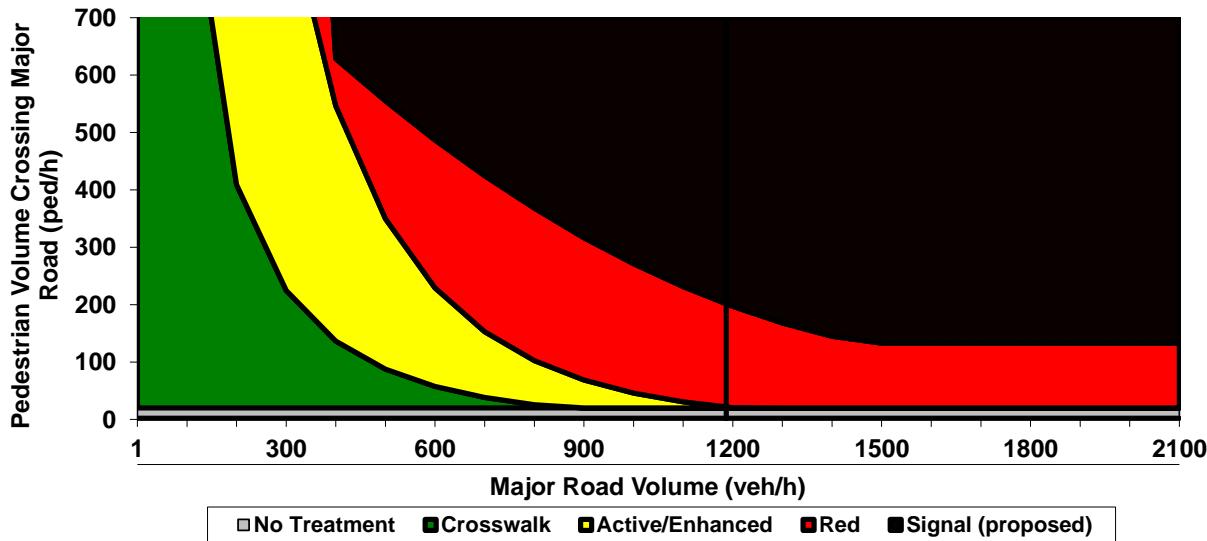

## GUIDELINES FOR PEDESTRIAN CROSSING TREATMENTS

This spreadsheet combines Worksheet 1 and Worksheet 2 (Appendix A, pages 69-70) of TCRP Report 112/NCHRP Report 562 (*Improving Pedestrian Safety at Unsignalized Intersections*) into an electronic format. This spreadsheet should be used in conjunction with, and not independent of, Appendix A documentation.

### Key

	This spreadsheet is still under development, please inform TTI if errors are identified.		
	Blue fields contain descriptive information.		
	Green fields are required and must be completed.		
	Tan fields are adjustments that are filled out only under certain conditions (follow instructions to the left of the cell).		

Analyst and Site Information			
Analyst	KAI	Major Street	3rd Avenue
Analysis Date	March 16, 2018	Minor Street or Location	N/A
Data Collection Date	February 7, 2018	Peak Hour	3:45 PM (Veh Peak - Sensitivity 1)
Step 1: Select worksheet:			
Posted or statutory speed limit (or 85th percentile speed) on the major street (mph)			1a
Is the population of the surrounding area <10,000? (enter YES or NO)			1b
Step 2: Does the crossing meet minimum pedestrian volumes to be considered for a traffic control device?			
Peak-hour pedestrian volume (ped/h), $V_p$			2a
Result: Consider raised median islands, curb extensions, traffic calming, etc. as feasible.			
Step 3: Does the crossing meet the pedestrian warrant for a traffic signal?			
Major road volume, total of both approaches during peak hour (veh/h), $V_{maj-s}$			3a
[Calculated automatically] Preliminary (before min. threshold) peak hour pedestrian volume to meet warrant			3b
[Calculated automatically] Minimum required peak hour pedestrian volume to meet traffic signal warrant			3c
Is 15th percentile crossing speed of pedestrians less than 3.5 ft/s (1.1 m/s)? (enter YES or NO)			3d
If 15th percentile crossing speed of pedestrians is less than 3.5 ft/s (1.1 m/s), then reduce 3c by up to 50%.		% rate of reduction for 3c (up to 50%)	3e
		Reduced value or 3c	3f
Result:			
Step 4: Estimate pedestrian delay.			
Pedestrian crossing distance, curb to curb (ft), $L$			4a
Pedestrian walking speed (ft/s), $S_p$ (suggested speed = 3.5 ft/s)			4b
Pedestrian start-up time and end clearance time (s), $t_s$ (suggested start-up time = 3 sec)			4c
[Calculated automatically] Critical gap required for crossing pedestrian (s), $t_c$			4d
Major road volume, total both approaches OR approach being crossed if raised median island is present, during peak hour (veh/h), $V_{maj-d}$			4e
Major road flow rate (veh/s), $v$			4f
Average pedestrian delay (s/person), $d_p$			4g
Total pedestrian delay (h), $D_p$ The value in 4h is the calculated estimated delay for all pedestrians crossing the major roadway without a crossing treatment (assumes 0% compliance). If the actual total pedestrian delay has been measured at the site, that value can be entered in 4i to replace the calculated value in 4h.			4h
			4i
Step 5: Select treatment based up on total pedestrian delay and expected motorist compliance.			
Expected motorist compliance at pedestrian crossings in region: enter HIGH for High Compliance or LOW for Low Compliance			5a
Treatment Category:		Consider raised median islands, curb extensions, traffic calming, etc. as feasible.	

This worksheet provides general recommendations on pedestrian crossing treatments to consider at unsignalized intersections; in all cases, engineering judgment should be used in selecting a specific treatment for installation. This worksheet does not apply to school crossings. In addition to the results provided by this worksheet, users should consider whether a pedestrian treatment could present an increased safety risk to pedestrians, such as where there is poor sight distance, complex geometrics, or nearby traffic signals.
